Risk-neutral probabilities

FTAP

THIS TIME

LECTURE 10 OUTLINE

Warm-up on risk-neutral probabilities and the FTAP

Portfolio choice fundamentals

Asset prices from supply and demand

WARM-UP

WHERE IS p ?

In binomial model, priced any security X as $X_0 = \frac{qX_u + (1-q)X_d}{1+r}$

$$\text{where } q = \frac{1+r-d}{u-d}$$

Why doesn't price depend on probability of up p ?

INTERPRETATION OF q

Suppose u and d equally likely ($p = 1/2$) but $q < 1/2$

Which state do you think represents a boom and which a recession?

UTILITY MAXIMIZATION

U MAXIMIZATION

U is function of consumption with $U' > 0$ and $U'' < 0$

$$\text{Max } U(c_0) + \delta \mathbb{E}[U(c_1)]$$

c_0 is consumption; c_1 risky consumption tomorrow

δ is rate of time preference

PORTFOLIO CHOICE & ASSET PRICING

PORTFOLIO CHOICE & ASSET PRICING

If (c_0, c_1) is consumed, supply to equal demand at (c_0, c_1)

Otherwise would buy/sell securities changing (c_0, c_1)

I.e. for any security X optimal quantity α of security is 0 given (c_0, c_1)

$$\alpha \text{ maximizes } U(c_0 - \alpha X_0) + \delta \mathbb{E}[U(c_1 + \alpha X_1)]$$

PORTFOLIO CHOICE & ASSET PRICING

If (c_0, c_1) is consumed, supply to equal demand at (c_0, c_1)

Otherwise would buy/sell securities changing (c_0, c_1)

I.e. for any security X optimal quantity α of security is 0 given (c_0, c_1)

$$\alpha \text{ maximizes } U(c_0 - \alpha X_0) + \delta \mathbb{E}[U(c_1 + \alpha X_1)] \implies \alpha = 0$$

FIRST-ORDER CONDITION

Max U over α for security X_0 :

FIRST-ORDER CONDITION

Max U over α for security X_0 :

$$-U'(c_0 - \alpha X_0)X_0 + \delta \mathbb{E}[U'(c_1 + \alpha X_1)X_1] = 0 \text{ for } \alpha = 0$$

FIRST-ORDER CONDITION

Max U over α for security X_0 :

$$\begin{aligned} -U'(c_0 - \alpha X_0)X_0 + \delta \mathbb{E}[U'(c_1 + \alpha X_1)X_1] &= 0 \text{ for } \alpha = 0 \\ \implies X_0 &= \frac{\delta \mathbb{E}[U'(c_1)X_1]}{U'(c_0)} \end{aligned} \quad (\star)$$

Often written $X_0 = \mathbb{E}[M_1 X_1]$ where $M_1 := \frac{\delta U'(c_1)}{U'(c_0)} \equiv \frac{\delta U'_1}{U'_0}$

M called “stochastic discount factor”

EQUILIBRIUM INTEREST RATE

Price bond using equation (★)

EQUILIBRIUM INTEREST RATE

Price bond using equation (★)

$$X_0 = \frac{1}{1+r} \text{ and } X_1 \equiv 1$$

EQUILIBRIUM INTEREST RATE

Price bond using equation (★)

$$X_0 = \frac{1}{1+r} \text{ and } X_1 \equiv 1 \implies \frac{1}{1+r} = \frac{\delta \mathbb{E}[U'(c_1)]}{U'(c_0)} \text{ or } \mathbb{E}[M_1] = \frac{1}{1+r}$$

EQUILIBRIUM INTEREST RATE

Price bond using equation (★)

$$X_0 = \frac{1}{1+r} \text{ and } X_1 \equiv 1 \implies \frac{1}{1+r} = \frac{\delta \mathbb{E}[U'(c_1)]}{U'(c_0)} \text{ or } \mathbb{E}[M_1] = \frac{1}{1+r}$$

Called “Euler equation” written as $U'(c_0) = (1+r)\delta \mathbb{E}[U'(c_1)]$

Can eat today or saving, getting interest, and eating tomorrow

Eating gives $U'(c_0)$

Saving gives $(1+r)\delta \mathbb{E}[U'(c_1)]$ (on average)

Must be indifferent for last unit of wealth

Else would consume something different from (c_0, c_1)

RE-WRITE (★)

Using Euler equation can re-write asset-pricing equation (★)

$$X_0 = \frac{1}{1+r} \mathbb{E} \left[\frac{U'_1}{\mathbb{E}[U'_1]} X_1 \right]$$

X_0 is discounted average of X_1 weighted by U' relative to average U'

RE-WRITE (★)

Using Euler equation can re-write asset-pricing equation (★)

$$X_0 = \frac{1}{1+r} \mathbb{E} \left[\frac{U'_1}{\mathbb{E}[U'_1]} X_1 \right]$$

X_0 is discounted average of X_1 weighted by U' relative to average U'

E.g. in binomial model:

RE-WRITE (★)

Using Euler equation can re-write asset-pricing equation (★)

$$X_0 = \frac{1}{1+r} \mathbb{E} \left[\frac{U'_1}{\mathbb{E}[U'_1]} X_1 \right]$$

X_0 is discounted average of X_1 weighted by U' relative to average U'

E.g. in binomial model:

$$X_0 = \frac{1}{1+r} \left(\frac{pU'_u}{\mathbb{E}[U'_1]} X_u + \frac{(1-p)U'_d}{\mathbb{E}[U'_1]} X_d \right)$$

RISK-NEURAL PROBABILITIES

Two ways to price: U' and $\mathbb{Q}$:

RISK-NEURAL PROBABILITIES

Two ways to price: U' and $\mathbb{Q}$:

RISK-NEURAL PROBABILITIES

Two ways to price: U' and $\mathbb{Q}$:

$$= \frac{1}{1+r} \left(qX_u + (1-q)X_d \right)$$

RISK-NEURAL PROBABILITIES

Two ways to price: U' and $\mathbb{Q}$:

$$= \frac{1}{1+r} \left(qX_u + (1-q)X_d \right)$$

$$\implies \mathbb{Q}[\omega] = \frac{\mathbb{P}[\omega]U'_\omega}{\mathbb{E}[U'_1]}$$

RISK-NEURAL PROBABILITIES

Two ways to price: U' and $\mathbb{Q}$:

$$= \frac{1}{1+r} \left(qX_u + (1-q)X_d \right)$$

$$\implies \mathbb{Q}[\omega] = \frac{\mathbb{P}[\omega]U'_\omega}{\mathbb{E}[U'_1]}$$

Pricing probability is real world probability adjusted for marginal U

RISK-NEURAL PROBABILITIES

Two ways to price: U' and $\mathbb{Q}$:

$$= \frac{1}{1+r} \left(qX_u + (1-q)X_d \right)$$

$$\implies \mathbb{Q}[\omega] = \frac{\mathbb{P}[\omega]U'_\omega}{\mathbb{E}[U'_1]}$$

Pricing probability is real world probability adjusted for marginal U

Concept check: If $\mathbb{Q}[\omega] > \mathbb{P}[\omega]$ is consumption high or low in state ω ?

COVARIANCE FORMULA

Use $\text{Cov}[X, Y] = \mathbb{E}[XY] - \mathbb{E}[X]\mathbb{E}[Y]$:

$$X_0 = \frac{1}{1+r} \left(\mathbb{E}[X_1] + \text{Cov} \left[\frac{U'_1}{\mathbb{E}[U'_1]}, X_1 \right] \right)$$

COVARIANCE FORMULA

Use $\text{Cov}[X, Y] = \mathbb{E}[XY] - \mathbb{E}[X]\mathbb{E}[Y]$:

$$X_0 = \frac{1}{1+r} \left(\mathbb{E}[X_1] + \text{Cov} \left[\frac{U'_1}{\mathbb{E}[U'_1]}, X_1 \right] \right) \text{ since } \mathbb{E} \left[\frac{U'_1}{\mathbb{E}[U'_1]} \right] = 1$$

Securities valued at expected value plus premium for covariance with U'

NB: Premium for negative covariance with c_1 since U'_1 decreasing

Expected excess return formulation for $R_X := \frac{X_1}{X_0}$:

$$\mathbb{E}[R_X] - (1+r) = -\text{Cov} \left[\frac{U'_1}{\mathbb{E}[U'_1]}, R_X \right]$$

CAPM

CAPM

Suppose linear marginal U : $U'(c_1) = \alpha - \gamma c_1$ and mkt return $R_M = \frac{c_1}{c_0}$

CAPM

Suppose linear marginal U : $U'(c_1) = \alpha - \gamma c_1$ and mkt return $R_M = \frac{c_1}{c_0}$

$$\mathbb{E}[U'_1] = \alpha - \gamma \bar{c}_1$$

CAPM

Suppose linear marginal U : $U'(c_1) = \alpha - \gamma c_1$ and mkt return $R_M = \frac{c_1}{c_0}$

$$\mathbb{E}[U'_1] = \alpha - \gamma \bar{c}_1$$

$$\text{Cov} \left[\frac{U'_1}{\mathbb{E}[U'_1]}, R_X \right] = \text{Cov} \left[\frac{\alpha - \gamma c_1}{\alpha - \gamma \bar{c}_1}, R_X \right] = -\frac{\gamma c_0}{\alpha - \gamma \bar{c}_1} \text{Cov} [R_M, R_X]$$

CAPM

Suppose linear marginal U : $U'(c_1) = \alpha - \gamma c_1$ and mkt return $R_M = \frac{c_1}{c_0}$

$$\mathbb{E}[U'_1] = \alpha - \gamma \bar{c}_1$$

$$\text{Cov} \left[\frac{U'_1}{\mathbb{E}[U'_1]}, R_X \right] = \text{Cov} \left[\frac{\alpha - \gamma c_1}{\alpha - \gamma \bar{c}_1}, R_X \right] = -\frac{\gamma c_0}{\alpha - \gamma \bar{c}_1} \text{Cov} [R_M, R_X]$$

Using cov formula above: $\frac{\mathbb{E}[R_X] - (1+r)}{\text{Cov}[R_M, R_X]} \equiv \frac{-\gamma c_0}{\alpha - \gamma \bar{c}_1} \equiv \text{const for any } X$

CAPM

Suppose linear marginal U : $U'(c_1) = \alpha - \gamma c_1$ and mkt return $R_M = \frac{c_1}{c_0}$

$$\mathbb{E}[U'_1] = \alpha - \gamma \bar{c}_1$$

$$\text{Cov} \left[\frac{U'_1}{\mathbb{E}[U'_1]}, R_X \right] = \text{Cov} \left[\frac{\alpha - \gamma c_1}{\alpha - \gamma \bar{c}_1}, R_X \right] = -\frac{\gamma c_0}{\alpha - \gamma \bar{c}_1} \text{Cov}[R_M, R_X]$$

Using cov formula above: $\frac{\mathbb{E}[R_X] - (1+r)}{\text{Cov}[R_M, R_X]} \equiv \frac{-\gamma c_0}{\alpha - \gamma \bar{c}_1} \equiv \text{const for any } X$

With $X = \text{mkt}$: $\frac{\mathbb{E}[R_X] - (1+r)}{\text{Cov}[R_M, R_X]} = \frac{\mathbb{E}[R_M] - (1+r)}{\text{Var}[R_M]}$

CAPM

Suppose linear marginal U : $U'(c_1) = \alpha - \gamma c_1$ and mkt return $R_M = \frac{c_1}{c_0}$

$$\mathbb{E}[U'_1] = \alpha - \gamma \bar{c}_1$$

$$\text{Cov} \left[\frac{U'_1}{\mathbb{E}[U'_1]}, R_X \right] = \text{Cov} \left[\frac{\alpha - \gamma c_1}{\alpha - \gamma \bar{c}_1}, R_X \right] = -\frac{\gamma c_0}{\alpha - \gamma \bar{c}_1} \text{Cov}[R_M, R_X]$$

Using cov formula above: $\frac{\mathbb{E}[R_X] - (1+r)}{\text{Cov}[R_M, R_X]} \equiv \frac{-\gamma c_0}{\alpha - \gamma \bar{c}_1} \equiv \text{const for any } X$

$$\text{With } X = \text{mkt: } \frac{\mathbb{E}[R_X] - (1+r)}{\text{Cov}[R_M, R_X]} = \frac{\mathbb{E}[R_M] - (1+r)}{\text{Var}[R_M]}$$

$$\implies \mathbb{E}[R_X] - (1+r) = \beta_X (\mathbb{E}[R_M] - (1+r)) \text{ where } \beta_X := \frac{\text{Cov}[R_M, R_X]}{\text{Var}[R_M]}$$

EXAMPLES

EXAMPLE: FAIR COIN

X is 0 if heads or 1 if tails on a fair coin flip

Is $\mathbb{E}[R_X] \leq 1 + r$?

EXAMPLE: MARKET

X pays off 1 if market goes up and zero otherwise

Is $\mathbb{E}[R_X] \leq 1 + r$?

EXAMPLE: VIRUSES

X pays off 1 if a pandemic is declared in 2023 and zero otherwise

Is $\mathbb{E}[R_X] \leq 1 + r$?

EXAMPLE: INTEREST RATES

X pays off 1 if interest rates go up and zero otherwise

Is $\mathbb{E}[R_X] \leq 1 + r$?

RECAP
